DECLARATION OF B. MARK HIRST PURSUANT TO 37 C.F.R. §1.131

Commissioner of Patents
Washington, D.C. 20231

Sir,

L. B. Mark Hirst, hereby declare that:

1) The invention embodied in the above-identified patent application is directed to fusing systems and devices that incorporate such fusing systems.

2) I am advised that the United States Patent and Trademark Office has rejected one or more claims presently pending in the above-identified patent application based, at least in part, upon United States Patent No. 6,304,741 to *Tange*. I am further advised that the effective filing date of the *Tange* patent is July 10, 2000.

3) The invention, however, as embodied in the claims of the present invention was completed by myself and my co-inventors in this country prior to July 10, 2000. Specifically, the invention was "completed" by virtue of reduction to practice prior to the July 10, 2000 filing date of the *Tange* patent.

4) As evidence that the present invention was so characterized by reduction to practice, Exhibit "A" is attached hereto.

5) Exhibit "A" is a copy of notebook entries from my notebook number 4276. As indicated on pages 37-42 of this notebook, an embodiment of the claimed invention was made and tested with positive results. All of these activities occurred prior to the July 10, 2000 critical date. Note that all dates contained on pages 37-42 have been redacted.

I hereby declare that all statements made herein are of my own knowledge are true and that all statements are made on information and belief and are believed to be true; and further, that these statements were made with the knowledge that willful false statements and the like so made are punishable by fine or imprisonment, or both, under Section 1001 of Title 18 of the United States Code, and that such willful false statements may jeopardize the validity of the application or any patent issued thereon.

DECLARATION OF KENNETH E. HEATH PURSUANT TO 37 C.F.R. §1.131

Commissioner of Patents
Washington, D.C. 20231

Sir,

I, Kenneth E. Heath, hereby declare that:

- 1) The invention embodied in the above-identified patent application is directed to fusing systems and devices that incorporate such fusing systems.

- 2) I am advised that the United States Patent and Trademark Office has rejected one or more claims presently pending in the above-identified patent application based, at least in part, upon United States Patent No. 6,304,741 to Tange. I am further advised that the effective filing date of the Tange patent is July 10, 2000.

3) The invention, however, as embodied in the claims of the present invention was completed by myself and my co-inventors in this country prior to July 10, 2000. Specifically, the invention was "completed" by virtue of reduction to practice prior to the July 10, 2000 filing date of the *Tange* patent.

4) As evidence that the present invention was so characterized by reduction to practice, Exhibit "A" is attached hereto.

5) Exhibit "A" is a copy of notebook entries from Mark Hirst's notebook number 4276. As indicated on pages 37-42 of this notebook, an embodiment of the claimed invention was made and tested with positive results. All of these activities occurred prior to the July 10, 2000 critical date. Note that all dates contained on pages 37-42 have been redacted.

I hereby declare that all statements made herein are of my own knowledge are true and that all statements are made on information and belief and are believed to be true; and further, that these statements were made with the knowledge that willful false statements and the like so made are punishable by fine or imprisonment, or both, under Section 1001 of Title 18 of the United States Code, and that such willful false statements may jeopardize the validity of the application or any patent issued thereon.

DECLARATION OF MARK WIBBELS PURSUANT TO 37 C.F.R. §1.131

Commissioner of Patents
Washington, D.C. 20231

Sir,

J. Mark Wibbels, hereby declare that:

- 1) The invention embodied in the above-identified patent application is directed to fusing systems and devices that incorporate such fusing systems.
- 2) I am advised that the United States Patent and Trademark Office has rejected one or more claims presently pending in the above-identified patent application based, at least in part, upon United States Patent No. 6,304,741 to *Tange*. I am further advised that the effective filing date of the *Tange* patent is July 10, 2000.

3) The invention, however, as embodied in the claims of the present invention was completed by myself and my co-inventors in this country prior to July 10, 2000. Specifically, the invention was "completed" by virtue of reduction to practice prior to the July 10, 2000 filing date of the *Tange* patent.

4) As evidence that the present invention was so characterized by reduction to practice, Exhibit "A" is attached hereto.

5) Exhibit "A" is a copy of notebook entries from Mark Hirst's notebook number 4276. As indicated on pages 37-42 of this notebook, an embodiment of the claimed invention was made and tested with positive results. EXHIBIT "A"

Project No. _____

TITLE Fusing System & External heating roller & No. _____

From Page No. _____

Present two roller fusing systems utilize aluminum rollers which are typically covered by a thick layer (4mm) of silicon rubber to maximize the width of the nip area for improved fusing. The silicon rubber is a poor thermal conductor which results in a fusing system which requires an excessive amount of time to bring to working temperature. For example, the HP 8500 laser printer requires 4 minutes & 20 seconds to achieve a working temperature of 180°C with two heated rollers each heated by 595 Watt quartz lamps. (190watts) Using an external heated metal roller eliminates a great portion of the thermal time delay in the sys. The following system was prototyped with 2 595 heater lamps:

This system produced warm-up time to 2 minutes. 50 seconds from 23°C to 180°C.

Experiments show some additional important benefits. These are: very quick response to thermal loads, as well, good ride through of sustained thermal loading. Additionally there is no decrease in the gloss of fused toner from one page to the next. The temperature of the fusing system recovers instantly as when the thermal load exits the nip of the fusing pressure rollers.

typical The ride through of present system shows considerable sag. ①

Ride through of new system

The sag in the ride through causes the gloss of the fused toner to decrease with every page.

From Page No. 39

This system also shows that the teflon coatings and silicon rubber of the pressure rollers can operate reliably at temperatures in excess of 210°C. Tests will be conducted with the surface of the external heating roller at 220°C, 230°C, and 240°C printing 100,000 pages.

as well as many other designs

One problem with this design is that the silicon rubber and teflon Coatings are isolators and are poor heat conductors as well as possess a small capacity to store heat energy at the surface. This causes the gloss of the fused toner to decrease over the fused page with each full rotation of the pressure rollers.

- For example for a ledger page the gloss for a solid red secondary color a

Fortunately with the external heater the system recovers for the next page.

Book No. _____ TITLE _____

From Page No. 39

To combat the problem of gloss sag within the page it is necessary to improve the amount of heat that can be carried into the nip of the fuser pressure rollers. A very thin metal layer ^{at} the surface of the upper pressure roller should do the trick. This idea is detailed on page 45 of this note book.

A prototype of this system was built with the following:

(system built to test resistances of silicon rubber and teflon to 220°C external to 300W)

as of 44,000 pages have been printed on above system with no failures. A second prototype in which the external heater is controlled at 220°C or 240°C will be constructed.

64,000 pages printed with no problems.

240,000 pages printed on two fusers with no problems

300,000 pages printed on two fusers with no problems

ect No. _____

Book No. _____

From Page No. _____

These life tests show no degradation of fuser roller material when heated via contact rolling with 240°C heating roller. This is a 3X life test on two different fusers.

a thermal model for present system is as follows

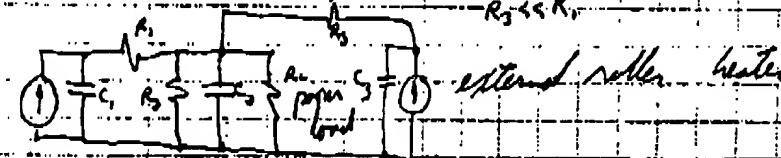

the problem is that the high thermal resistance of the coating surface limits energy transport from the fuser.

the external heating roller significantly decreases the thermal resistance of the system by applying energy directly to the surface of the fuser

roller thermal resistance
